

hEX series

First use

- Connect your Internet cable to port 1 (labeled “Internet”), and local network computers to ports 2-5
- Set your computer IP configuration to automatic (DHCP)
- The IP address from local network is 192.168.88.1, use it in your browser to access the device

Powering

The device accepts powering from the power jack or from the first Ethernet port (Passive PoE):

- Direct input power jack (5.5mm outside and 2mm inside, female, pin positive) accepts 8-30 V DC.
- The first Ethernet port accepts passive Power over Ethernet accepts 8-30 V DC.

The power consumption of this device under maximum load is up to 3 W.

Booting process

The device is already configured and protected from the internet side. Once your PC is connected to one of the LAN ports, open <http://192.168.88.1> in your web browser to start configuration. Since there is no password by default, you will be logged in automatically. Set up your password in the screen that loads. RouterOS includes many configuration options in addition to what is described in this document. We suggest to start here to get yourself accustomed to the possibilities: <http://mt.lv/help>.

In case IP connection is not available, the Winbox tool (<http://mt.lv/winbox>) can be used to connect to the MAC address of the device from the LAN side (all access is blocked from the internet port by default). For recovery purposes, it is possible boot the device from network, see section Buttons

Extension Slots and Ports

The device has five individual Ethernet ports, supporting automatic cross/straight cable correction (Auto MDI/X), so you can use either straight or cross-over cables for connecting to other network devices. The Ethernet port accepts 8-30 V DC powering from a passive PoE injector, 12 V or more is recommended to compensate for loss in cables.

Buttons

Reset button

- Hold this button during boot time until LED light starts flashing, release the button to reset RouterOS configuration (total 5 seconds).
- Keep holding for 5 more seconds, LED turns solid, release now to turn on CAP mode. The device will now look for a CAPsMAN server (total 10 seconds).
- Or Keep holding the button for 5 more seconds until until LED turns off, then release it to make the RouterBOARD look for Netinstall servers (total 15 seconds).

Regardless of the above option used, the system will load the backup RouterBOOT loader if the button is pressed before power is applied to the device. Useful for RouterBOOT debugging and recovery.

Mode button

The action of the mode buttons can be configured from RouterOS software to execute any user supplied RouterOS script. You can also disable this button. The mode button can be configured in RouterOS menu `/system routerboard mode-button`

Operating System Support

The device supports RouterOS software with the version number at or above what is indicated in the RouterOS menu `/system resource`. Other operating systems have not been tested.

CE Declaration of Conformity

Full Declaration of Conformity (DoC) may be obtained by visiting our product page on
